## Описание проекта

В данном проекте была создана база данных для службы доставки товаров. Она включает в себя таблицы

Модели базы данных созданы в инструменте Oracle SQL Developer Data Modeler

База данных реализована в системе управления базами данных MySQL.

Клиентское приложение написано на Java.

## Логическая модель базы данных

В Data Modeler была создана логическая модель базы данных (рисунок 1).

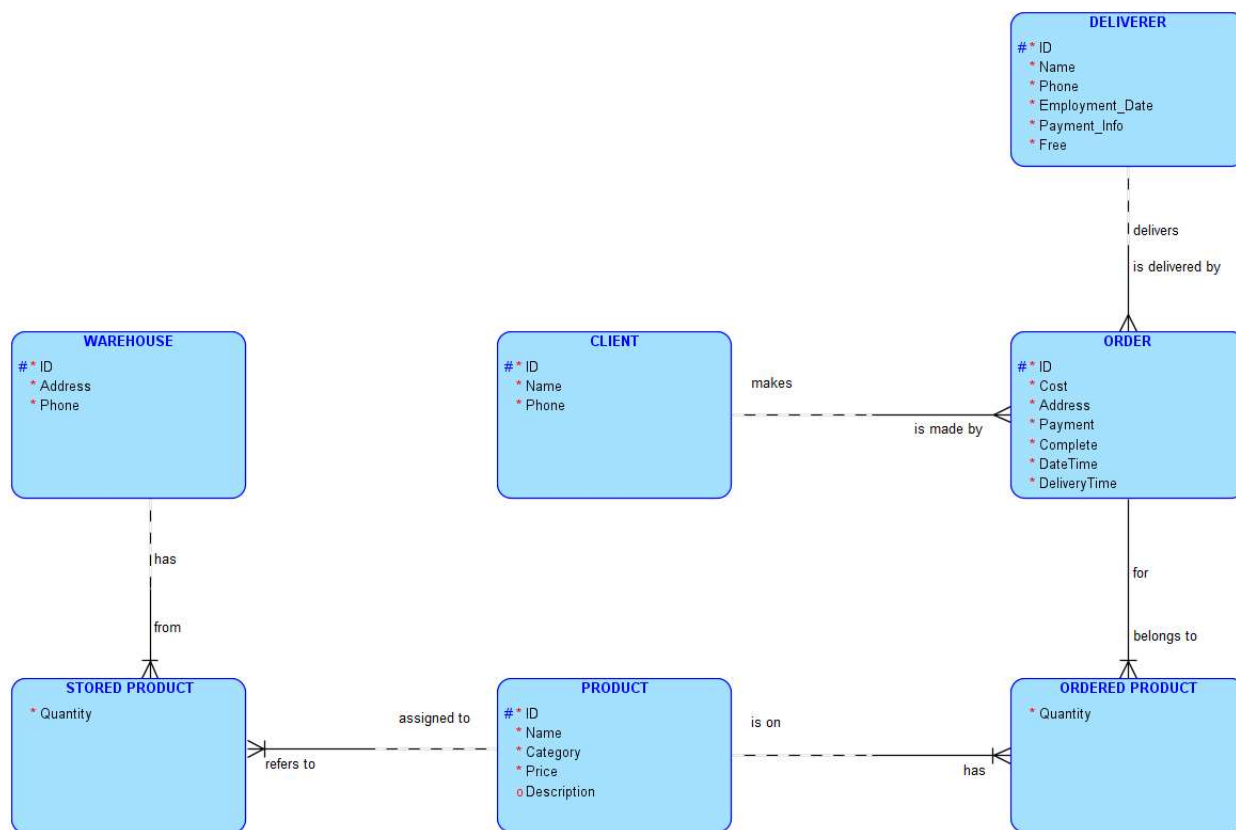

Рисунок 1 — Логическая модель базы данных

## Реляционная модель базы данных

Логическая модель была преобразована в реляционную (рисунок 2). Сущности были преобразованы в таблицы, атрибуты - в поля таблиц.

- CLT – CLIENT
- DLV – DELIVERER
- ORD – ORDER
- PRD – PRODUCT
- OPR – ORDERED PRODUCT
- WRH – WAREHOUSE
- SPR – STOCKED PRODUCT

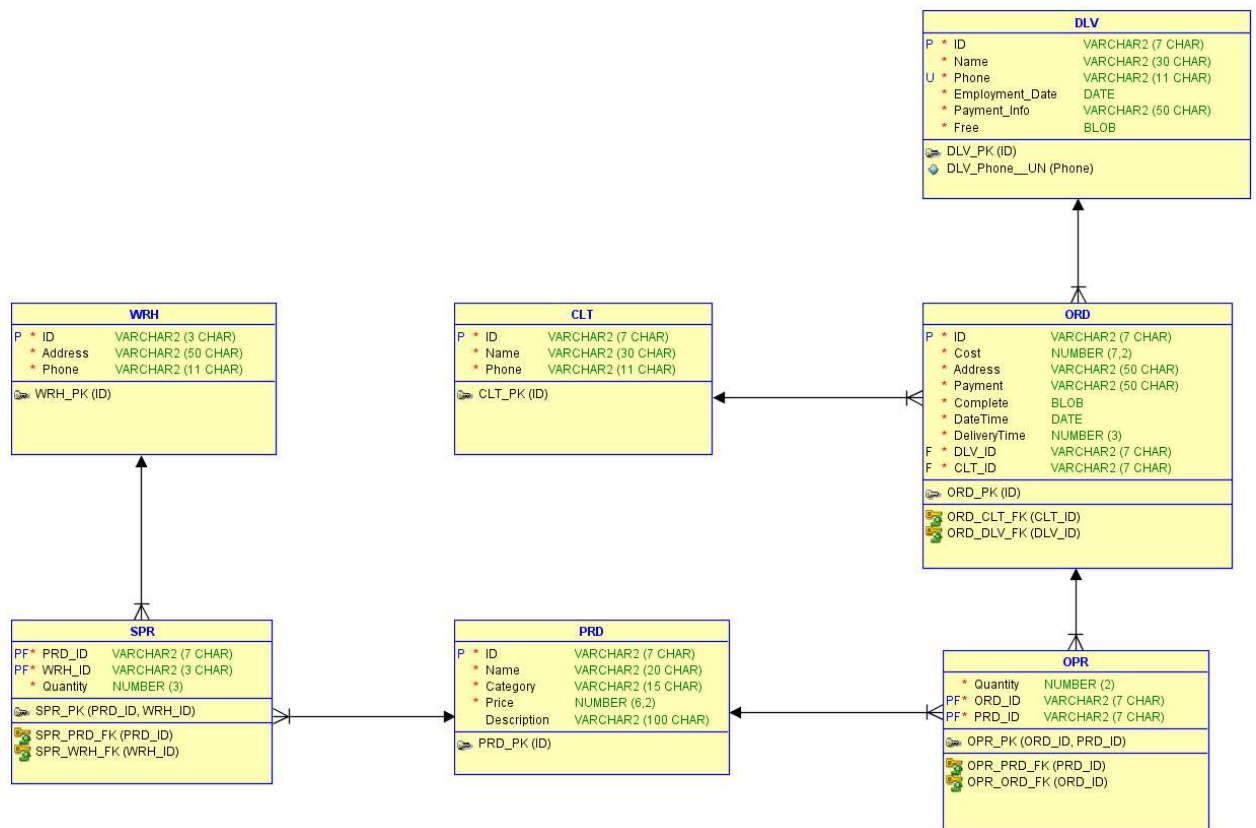

Рисунок 2 — Реляционная модель базы данных

## Создание базы данных в MySQL

Проанализируем правила предметной области.

- Цена товаров/заказа должна быть больше 0;
- Нельзя заказать больше товаров, чем есть на складе;
- Количество товара на складе должно быть  $\geq 0$ ;
- Количество товара в заказе должно быть больше 0;
- Цена заказа складывается из суммы цен товаров в заказе;
- Номера телефонов должны быть в формате 8xxxxxxxxx;

С помощью Data Modeler сгенерировали DDL-скрипт для создания таблиц и адаптировали его под работу в MySQL (приложение 1). Добавляем ограничения и заполняем таблицы с помощью скриптов с DML командами (приложение 2 и 3).

Заполненные таблицы:

```
mysql> select * from clt;
+----+-----+-----+
| id | name  | phone |
+----+-----+-----+
| 11 | Nina  | 88118876532 |
| 12 | Tanya | 88117653979 |
| 13 | Maria | 88119871352 |
| 14 | Anna  | 88110962856 |
| 15 | Klava | 88118594738 |
+----+-----+-----+
5 rows in set (0.00 sec)
```

Рисунок 3 – таблица CLT (клиентов)

```
mysql> select * from dlv;
+----+-----+-----+-----+-----+-----+
| id | name  | phone | employment_date | payment_info | free |
+----+-----+-----+-----+-----+-----+
| 21 | Iosif | 89117462056 | 2015-01-01 10:01:15 | 4716998573225739 | 1 |
| 22 | Kolya | 89117689834 | 2017-02-01 10:01:15 | 4532896698742905 | 1 |
| 23 | Zina  | 89118926547 | 2020-03-24 09:12:15 | 4916965832084304 | 1 |
| 24 | Polina | 89118876543 | 2001-12-01 06:01:15 | 4929746864519044 | 1 |
| 25 | Frosia | 89116657493 | 2016-07-05 07:12:59 | 4929420584685895 | 1 |
+----+-----+-----+-----+-----+-----+
5 rows in set (0.01 sec)
```

Рисунок 4 – таблица DLV (доставщиков)

```
mysql> select * from ord;
```

id	cost	address	payment	complete	datetime	deliverytime	dlv_id	clt_id
31	35.00	street 1, house 1	cash	1	2020-03-25 07:12:59	40	21	11
32	3.00	street 2, house 2	cash	1	2020-03-27 09:12:59	30	22	12
33	50.00	street 3, house 3	cash	1	2020-03-15 12:44:01	150	23	13
34	16.00	street 4, house 4	cash	1	2020-03-17 15:13:43	90	24	14
35	21.00	street 5, house 5	cash	1	2020-03-20 07:12:59	45	25	15

```
5 rows in set (0.00 sec)
```

Рисунок 5 – таблица ORD (заказов)

```
mysql> select * from prd;
```

id	name	category	price	description
41	potato	vegetables	5.00	fresh
42	carrot	vegetables	3.00	fresh
43	chocolate	sweet	10.00	tasty but bad
44	soap	household goods	15.00	always need
45	candy	sweet	4.00	tasty but bad

```
5 rows in set (0.00 sec)
```

Рисунок 6 – таблица PRD (продуктов)

```
mysql> select * from opr;
```

quantity	ord_id	prd_id
3	31	41
2	31	43
1	32	42
5	33	43
4	34	45
3	35	41
2	35	42

```
7 rows in set (0.02 sec)
```

Рисунок 7 – таблица OPR (заказанных товаров)

```
mysql> select * from wrh;
```

id	address	phone
51	street 6, house 6	89116573848
52	street 7, house 7	89113456274
53	street 8, house 8	89116592746
54	street 9, house 9	89116342856
55	street 10, house 10	89116482064

```
5 rows in set (0.00 sec)
```

Рисунок 8 – таблица WRH (складов)

```
mysql> select * from spr;
+-----+-----+-----+
| prd_id | wrh_id | quantity |
+-----+-----+-----+
| 41     | 51     | 20       |
| 41     | 54     | 40       |
| 42     | 53     | 15       |
| 42     | 55     | 70       |
| 43     | 51     | 11       |
| 44     | 52     | 12       |
| 45     | 51     | 6        |
| 45     | 53     | 2        |
+-----+-----+-----+
8 rows in set (0.00 sec)
```

Рисунок 9 – таблица SPR (товаров на складе)

Соответствие нормальным формам:

1НФ:

Все поля таблиц имеют только одно значение.

2НФ:

Все таблицы соответствуют 1НФ и каждое поле каждой таблицы зависит от полного первичного ключа.

Таблицы client (CLT), deliverer (DLV), order (ORD), warehouse (WRH), products (PRD) – первичный ключ состоит из id. От него зависят все атрибуты.

Таблицы ordered product (OPR), stocked product (SPR) – первичный ключ состоит из id заказа или склада соответственно и id продукта. От него зависят остальные атрибуты (количество).

3НФ:

Все таблицы соответствуют 2НФ и поля таблиц не составляют транзитивных зависимостей.

Ни в одной таблице поле не зависит ни от какого другого поля, кроме полей, входящих в первичный ключ.

НФБК:

Во всех таблицах отсутствуют функциональные зависимости между полями, входящими в первичный ключ таблицы.

Таблицы client (CLT), deliverer (DLV), order (ORD), warehouse (WRH), products (PRD) – первичный ключ состоит только из одного атрибута (id).

Таблицы ordered product (OPR), stocked product (SPR) – при изменении id заказа/склада может остаться неизменным id товара.

## Создание клиентского приложения

Написано на Java. Код в приложении 4.

Позволяет делать заказы, просматривать таблицу клиентов, товаров.

Финальная версия приложения выглядит так:

The screenshot displays the Polydelivery application interface, which is divided into three main panels: Catalogue, Order, and Admin.

**Catalogue Panel:** This panel lists various items with their descriptions, prices, and a 'total' value. The items are:

- potato: fresh vegetables, 5.0p, total:0.0p
- carrot: fresh vegetables, 3.0p, total:0.0p
- chocolate: tasty but bad, 10.0p, total:0.0p
- soap: always need household goods, 15.0p, total:0.0p
- candy: tasty but bad, 4.0p, total:0.0p

**Order Panel:** This panel contains fields for placing an order. It includes a 'total: 0p' label, a 'refresh' button, an 'Address:' label, a 'District' dropdown menu, an 'address' input field, a 'Client' dropdown menu, a 'Payment option' dropdown menu, and an 'ORDER' button.

**Admin Panel:** This panel contains a 'Show clients' button and a 'LOG' section.

## Тестирование приложения

### Неверные входные данные

#### Несоответствие типов

Программно отключена возможность ввести больше двух цифр (и только цифр) в поле количества товара.

В тестировании внешний вид приложения немного отличается от финальной версии.

#### Заполнены не все поля

В лог выйдет сообщение об ошибке при отсутствии информации о заказчике...

The screenshot shows the Polydelivery application interface. The 'Catalogue' panel on the left lists items: potato (5.0p), carrot (3.0p), chocolate (10.0p), soap (15.0p), and candy (4.0p), each with a quantity input field and a 'total' field. The 'Order' panel in the center has fields for 'total: 0p', 'Address:', 'District' (a dropdown menu), 'Client' (a dropdown menu), and 'Payment option' (a dropdown menu). There is a 'refresh' button and an 'ORDER' button. The 'Admin' panel on the right has 'Refresh info' and 'Show clients' buttons. The 'LOG' section displays the message: 'Either address, district, payment or client ID is empty. Aborting process.'

...или товаров.

The screenshot shows the Polydelivery application interface with the 'Order' form filled out. The 'total' field now shows '0.0'. The 'Address' field is filled with 'street B, house 4'. The 'District' dropdown is set to '51'. The 'Client' dropdown is set to '13'. The 'Payment option' dropdown is set to 'cash'. The 'ORDER' button is highlighted. The 'Admin' panel on the right has the same buttons. The 'LOG' section displays the message: 'Either address, district, payment or client ID is empty. Aborting process.' followed by several lines of error messages: 'Max length of address is 50 symbols!', 'WRH51 soap - out of stock. Aborting process.', and 'The shopping cart is empty.'

Ввод данных больше допустимой длины

Максимальная длина адреса – 50 символов. Возможность ввести новый символ будет программно заблокирована, останется только удалять предыдущие. В логе будет об этом сообщение.

The screenshot shows the Polydelivery application interface. On the left is the 'Catalogue' with items: potato (5.0p), carrot (3.0p), chocolate (10.0p), soap (15.0p), and candy (4.0p). Each item has a checkbox and a 'total' field. In the center is the 'Order' form with fields for 'total: 0p', 'refresh', 'Address:', 'District' (dropdown), 'Client' (dropdown), 'Payment option' (dropdown), and an 'ORDER' button. On the right is the 'Admin' panel with 'Refresh info' and 'Show clients' buttons, and a 'LOG' section displaying the message: 'Either address, district, payment or client ID is empty. Aborting process. Max length of address is 50 symbols!'. The 'District' dropdown in the Order form contains the text 'ahahahahahahah'.

## Создание заказа

На складе может быть недостаточно товаров...

The screenshot shows the Polydelivery application interface. On the left is the 'Catalogue' with items: potato (5.0p), carrot (3.0p), chocolate (10.0p), soap (15.0p), and candy (4.0p). Each item has a quantity input field and a 'total' field. In the center is the 'Order' form with fields for 'total: 68.0p', 'refresh', 'Address:', 'District' (dropdown), 'Client' (dropdown), 'Payment option' (dropdown), and an 'ORDER' button. On the right is the 'Admin' panel with 'Refresh info' and 'Show clients' buttons, and a 'LOG' section displaying the message: 'ID: 11 Name: Nina Phone: 88118876532 ID: 12 Name: Tanya Phone: 88117653979 ID: 13 Name: Maria Phone: 88119871352 ID: 14 Name: Anna Phone: 88110962856 ID: 15 Name: Klava Phone: 88118594738 candy - Ordered: 12 In Stock: 6 Aborting process.' The 'District' dropdown in the Order form contains the text '51' and the 'Address' field contains the text 'street 1, house 3'.

...или вовсе не быть. Различие в том, что в первом случае запрос к SQL вернет количество, а во втором случае – придет пустой ответ, поэтому handling разный.

8 rows in set (0.00 sec)

Доставщик выбирается случайный из доступных, время доставки – случайное число от 25 до 44.

## Тестирование базы данных

Каким образом предотвращается insert/update неверных значений?

Работа производится на MySQL 5.0.67, поэтому вместо CONSTRAINT... CHECK (это поддерживается только на MySQL 8.0.16 и старше) используется TRIGGER... BEFORE INSERT ON...

Пример триггера (предотвращает добавления товаров, чья цена меньше или равна 0):

```
triggers.sql
delimiter $$
create trigger prd_price before insert on PRD
for each row
begin
if new.price <= 0 then
CALL raise_error;
end if;
end;$$
```

При срабатывании условия можно было бы использовать, например, signal sqlstate '45000', что вызвало бы пользовательскую ошибку 45000, но signal sqlstate поддерживается только на MySQL 5.5 и старше, поэтому используем костыль: вызываем несуществующую функцию raise\_error. Возникает ошибка, и новая строчка не вставляется, что и было нашей целью.

У товаров должна быть положительная цена. Пробуем добавить товар с ценой 0 и -1:

```
mysql> insert into prd values(46, 'juice', 'liquid', 0, 'apple');
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
mysql> insert into prd values(46, 'juice', 'liquid', -1, 'apple');
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
```

У заказа должна быть положительная цена. Пробуем добавить заказ с ценой (второй атрибут) 0:

```
mysql> insert into ord values(39, 0, 'ha', 'cash', 1, '2020-06-04 15:53:57', 31, 22, 16);
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
```

Количество товара на складе неотрицательно. Пробуем добавить продукт №45 на склад №52 с количеством -30:

```
mysql> insert into spr values (45, 52, -30);
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
```

Количество заказанного товара положительно. Пытаемся поместить 0 штук товара №44 в заказ №38.

```
mysql> insert into opr values (0,38,44);  
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
```

Номера телефонов должны быть в формате 8xxxxxxxxx.

Присутствует символ:

```
mysql> insert into clt values(17,'Ivan','8123456789t');  
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
```

Длина меньше 11 (здесь 10):

```
mysql> insert into clt values(17,'Ivan','8123456789');  
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
```

Начинается не с 8:

```
mysql> insert into clt values(17,'Ivan','71234567890');  
ERROR 1305 (42000): PROCEDURE tanya.raise_error does not exist
```

Длина больше 11:

```
mysql> insert into clt values(17,'Ivan','712345678905');  
ERROR 1406 (22001): Data too long for column 'phone' at row 1
```

## Приложение 1

inittables.ddl

```
CREATE TABLE clt (

    id      VARCHAR(7) NOT NULL,
